

(a) Outcome class over all assigned trials

dashed rule — 14 of 64 got past the obstacle position, all 14 of them by going through the box, and 1 of those (s4434) reached the goal region, also through the box

box height (cm), obstacle at x = 1.2 m

- intersected the box, past the obstacle position
- intersected the box, short of the obstacle position
- evaluator cutoff (none of them past the obstacle)
- ▨ timeout — not assessed (no time limit configured)
- rejected / fell / collided_wall / stalled / completed — 0

(b) All eight classes, in precedence order

rejected	0	0	0	0	0	0
fell	0	0	0	0	0	0
collided_obstacle	21	21	22	25	30	31
collided_wall	0	0	0	0	0	0
cutoff	43	43	42	39	34	33
timeout	n/a	n/a	n/a	n/a	n/a	n/a
stalled	0	0	0	0	0	0
completed	0	0	0	0	0	0
	3	5	8	12	20	30

box height (cm)

timeout is not a zero: the analysis set no time limit, which disables the class, so no trial could be classed as timed out. “stalled” is the residual class, preempted by both the collision and the cutoff classes.

Obstacle ABSENT from the physics scene: “intersected the box” means the recorded motion intersects the box geometry in replay — the robot never felt contact and its controller was never perturbed by a box. One route, one scene, physics seed 0, one rollout per reference; descriptive. 64 archived EXP-022A achieved states; the tracker's evaluator cut off 53 of them at every height, of which 10–20 are classed as collisions by precedence.
